Rainwater Harvesting System

1 inch of rain on 2000 sq. ft. produces 1,250 gallons of reusable water.
Rainwater can be collected from your roof and specially designed patios/driveways.
Systems can be stored below a water feature or a permeable surface.

By Using Harvested Rainwater You Can

- Conserve by recycling our most valuable resource
- Save money by reducing water usage fees
- Help reduce stormwater runoff
- Make stored rainwater available for your landscape irrigation

Benefits of Installing a Rainwater Harvesting System

Underground Storage of Harvested Rainwater is often combined with Water Features that provide beautiful focal points and wildlife habitats. Pondless waterfalls and watercourses attract many types of wildlife. Water Features as well as Fountainscapes on a permeable patio also provide the soothing sound of water.

To inquire about having your own customized Rainwater Harvesting System designed and installed or for more information please call: (650) 726-7024

Staff on hand: Field Biologist and Biological Systems Engineer

Coastal Range Landscaping has over 24 years of dedication to designing and installing attractive and sustainable landscapes with water conservation and environmental enhancement as integral parts of the process.
